

## 通信工学専攻/Department of Communication Engineering

Professor SUZUKI I	iaowei O Koichi	Doctor of Engineering  Doctor of Engineering  Doctor of Information Sciences	I am engaged in a study of auditory impression of the utterance. The following is a study of expression associated with auditory impression example.  Japanese expressions associated with the voice quality of male adults were extracted by a series of questionnaire surveys and statistical multivariate analysis. By applying a statistical clustering method and a correlation analysis to the results of the questionnaires, eight bipolar expressions and one unipolar expression were obtained. They constituted high-pitched /low-pitched, masculine/feminine, hoarse/clear, calm/excited, powerful/weak, youthful/ elderly, thick/thin, tense/lax, and nasal, respectively.  In order to realize a supple society where the electronic devices can be charged anywhere and anytime without using any complex electric code connections, the research of our laboratory focuses on how to develop a high-efficiency wireless power transfer (WPT) system. Lots of practical applications are being proceeded using our previously developed optimal design technique and maximum efficiency evaluation technology for multiple-input and multiple output systems (MIMO-WPT) which are based on electromagnetic numerical simulation technique and the multi-ports circuit theory. Meanwhile, the research on higher efficiency matching circuits and rectifier circuits is also energetically progressing. In the laboratory, you can easily experience to design and evaluate a WPT practical systems such as mini 4WD and drones that can run without batteries.  My research focuses on developments and applications of information technologies using satellite remote sensing, satellite image processing, computer network, database, and other types of information processing to help people monitor the earth environment.  Principal areas of interest are disaster monitoring of Northeast Asia (forest fire, dust and sandstorm, snow, sea ice, and etc) , developing algorithms for category extraction and its visualization, and constructing large scale database of satellite images. There are ab

Professor SATO Ats	Eisuke		
Professor SATO Ats  Professor SUZUKI R	Eisuke		visualization, and constructing large scale database of satellite images. There are about
Professor SATO Ats  Professor SUZUKI R	Eisuke		140,000 scenes of NOAA AVHRR images since 1981.
Professor SATO Ats  Professor SUZUKI R	Eisuke		Mobile communication system (i.e. smart phone, WiFi) becomes very familiar. We study on
Professor SATO Ats	Eisuke	Doctor of Engineering	mobile radio communication and its applied technologies like IoT (Internet of Things) . For
Professor SUZUKI I			example, we visualize radio signals by using the inexpensive microcomputer board. We also
Professor SUZUKI I			estimate location using Zigbee sensor network and perform wireless transmission experiment
Professor SUZUKI I			using a software defined radio system.
Professor SUZUKI I			My research has concentrated on the development of near-infrared solid-state lasers for
Professor SUZUKI I			laser radar remote sensing. The laser radar using a laser transmitter operating in the eye-
	SATO Atsushi	Doctor of Engineering	safe wavelength region around 2 microns provides carbon dioxide profiles and wind velocity
			profiles with high measurement precision.
			My major research topics include computer architecture and memory systems.
			The most essential components of a modern computer are microprocessor and memory. In
	Kenichi	Doctor of Information Sciences	order to achieve successive performance improvement of the computer system, both of the
Professor TAMURA	remen	Doctor of information sciences	processor and memory must be developed continuously. In my laboratory, we are making
Professor TAMURA			efforts to obtain the structure of microprocessor and memory that realizes a low-power and
Professor TAMURA			high performance computer system.
Professor TAMURA			For practical applications of the ultrasonic motors and the multi-axial monolithic vibrational
Professor TAMURA		Doctor of Engineering	gyrosensors, the piezoelectric resonators with degenerated or coupled multiple modes are
Professor TAMURA	TAMURA Hideki		studied.
			In addition, under the large strain for the high-power application, the piezo-resonator
			produces nonlinear effect and deteriorates its properties; therefore, we have studied the
i			high-power characterization method of the resonator to assist the suitable structural design
	ļ		and material selection.  Computer networks have been basic information infrastructure of our daily life. The network
	TSUNODA Hiroshi	Doctor of Information Sciences	management is an important but a difficult task because of the complexity of the computer
Dyefocosy			network, and various security incidents like illegal accesses are increasing. In order to solve
Professor TSUNOD			various security problems, I am engaged in research on network management and security
			management. Currently, I am working on reliable logging architecture, mutual node
			monitoring system for sensor networks, and intrusion detection mechanism based on traffic
		+	monitoring.  The main area of my research activity is 3-dimensitonal structure of the solar wind magnetic
Professor NAKAGA	NAKAGAWA Tomoko	Doctor of Science	field, solar wind interaction with the planets and moon, and improvement of calibration and
I TOTOSSOT INANAGA			noise reduction of electromagnetic measurement from spacecraft.
		Doctor of Engineering	My research interests focus on cognitive neuroscience using functional MRI and NIRS, and
			its application to cognitive engineering. In particular, I am interested in problems arising in
Professor MIURA N			human-machine interactions, such as human errors, and in social interactions between
IVIIOTA IV	Janki		humans and humans. To understand the cognitive mechanisms underlying these
	Naoki		interactions, experimental studies are conducted using several neuroimaging techniques.
	Naoki	+	I research and develop the network system based on database which consists of embedded
	Naoki	Doctor of Engineering	system, client and Server. There are not only the software developments but also the results
Professor MATSUD	Vaoki 		of the development of the network hardware. The network microcomputer boards which we
		Doctor of Engineering	work in collaborate with company is sold. We make much of engineering as the practical
	Naoki DA Masahiro	Doctor of Engineering	

## 通信工学専攻/Department of Communication Engineering

教員紹介/Teaching Staff

職位/Title	氏名/Name	学位/Education	研究内容/Research
Associate Professor		Doctor of Science	My research interests include analysis and modeling of human communication in both face-
			to-face and online interactions. I am currently working on the analysis and modeling methods
	INOUE Masashi		and development of intelligent interactive systems. Additionally, I have investigated how
	INOUL Wasasiii		people use different media, such as video or text, for communication. I aim to apply my
			findings on cognitive and behavioral processes to professional dialogue and situated
			communication, such as interactions during events and local activities.
Associate Professor			Radio waves are emitted from natural phenomena such as lightning, solar flares, and
			planetary auroras.
			We can detect them using a radio telescope, a specialized antenna which receives radio
			waves. Our laboratory is investigating planetary magnetospheres and the interaction between
	KITA Hajime	Doctor of Science	the planets and the sun.
			Using a variety of radio observation technology, we are primarily observing the time-spatial
			variation of Jupiter's magnetosphere. Additionally, we study exoplanetary systems with the
			goal of finding common phenomena between planets. We strive to understand planetary
			science as well as develop radio observation technology.
Associate Professor			THz-wave generation and detection based on nonlinear wavelength conversion
			THz-wave sensing applications: real-time gas sensing, and imaging
	NAWATA Kouji	Doctor of Engineering	Development of near infrared lasers for efficient NIR-THz-wave conversion
			Design of PPLN crystal for effective NIR-THzwave conversion
			Development of tunable, narrowband OPG sources using KTP crystal
Associate Professor			My main research interests include construction of high performance digital signal processing
			systems.
			Digital signal processing is one of the techniques to process signal data, such as acoustic
	YAMAKI Shunsuke	Doctor of Engineering	signals, image signals, and video signals. In order to construct high performance digital signal
			processing systems for any signal data existing around us, my research activities especially
			focus on design of high accuracy digital filters, development of high accuracy signal matching
			techniques, application to biological signal analysis, application to artificial intelligence, and
			so force.
Lecturer			Technology is changing the way we learn, play, and communicate. My research focuses on
		Destar of Course to C	developing smart communication systems that benefit human being using VR, AI, and
	NGUYEN Vanduc	Doctor of Computer Science and	advanced communication technologies. Specifically, we are conducing research on Al robots
		Engineering	that can communicate and support various daily tasks with people, telepresence systems
			that make you feel like you are in a certain place instead of the actual place, and virtual
			space where you can hang out with your friends as if you were in the same room.
